

OsservaVPN by Sharelock

Monitor **your VPN** as a **meticulous observer** does. Don't trust routine checks. **Inspect strange behaviours** instead.

The VPN is today's weakest link, and current access security controls are primitive, and **that's why ransomware attackers exploit it**.

OsservaVPN is an **easy-to-use Cloud service** for detecting security risks on your VPN using advanced machine-learning behavioural insights applied to your VPN log file.

OsservaVPN provides **alerts correlating multiple behavioural anomalies** against several different baselines, significantly minimizing the number of false positives:

- User anomalies against individual user habits
- Geographical anomalies against individual country habits
- Device anomalies against overall failed password habits.

- 01 SaaS, per active user pay-as-you-go.
- 02 Quick activation.
- 03 Data stored in your AWS region.
- 04 No configuration required. Machine learning does the work.
- 05 Add additional log files later (e.g. MS365) for cross-application alerts.
